"Identification and characterization
                                                                                                                         that induces apoptosis.";

Immunity 3:673-682(1995).

-I-FUNCTION: Cytokine that binds to TNFRSF10A/TRAILR1,

TNFRSF10B/TRAILR2, TNFRSF10C/TRAILR3, TNFRSF10D/TRA

possibly also to TNFRSF11B/OPG. Induces apoptosis.

may be modulated by binding to the decoy receptors

TNFRSF10C/TRAILR3, TNFRSF10D/TRAILR4 and TNFRSF11B/
                                                                                                                                                                                                                                                                                                                                                                                                                                    p50592;

Osteoclast differentiation and activation factor Augments the ability of dendritic cells to stimulate naive T-ce proliferation. May be an important regulator of interactions between T cells and dendritic cells and may play a role in the regulation of the T cell-dependent immune response. May also plan important role in enhanced bone-resorption in humoral hypercalcemia of malignancy.

form lobulo

alveolar mammary structures during pregnancy, resulting in death of newborns. Trance-deficient mice show severe osteopetrosis, with no osteoclasts, marrow spaces, or tooth eruption, and exhibit profound growth retardation at several skeletal sites, including the limbs, skull, and vertebrae and have marked chondrodysplasia, with thick, irregular growth plates and a relative increase in hypertrophic chondrocytes.

SIMILARITY: Belongs to the tumor necrosis factor family.

Blophys. Res. Commun. 269:532-536(2000).

FUNCTION: Cytckine that binds to TMPRSF11B/OPG and to TWPRSF11B/OPG and to Stimulate naive T-cell Augments the ability of dendritic cells to stimulate naive T-cell proliferation. May be an important regulator of interactions between T cells and dendritic cells and may play a role in the regulation of the T cell-dependent immune response. May also play an important role in enhanced bone-resorption in humoral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          proteolytic processing (By similarity).                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: Cytokine that binds to TNFRSF6/FAS, a receptor that transduces the apoptotic signal into cells. May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TNFRSF6/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DcR3 modulates its effects (By similarity). SUBCELIULAR LOCATION: Type II membrane protein (isoform FASI);
                                                                                                                   IsoId-P41047-2; Sequence=VSP 006445; PTM: The soluble form derives from the membrane proteolytic processing (By similarity). DISEASE: A deficiency in this protein is the cau lymphoproliferation disease phenotype (gld). Gld lymphadenopathy and autoantibody production. The recessively inherited.
                                                                                             SIMILARITY: Belongs to the tumor necrosis factor family.
                                                                                                                                                                                                                                                                                                                                                                                           Secreted (isoforms FASL and ALTERNATIVE PRODUCTS:

May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TNFRSF6/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DcR3 modulates its effects (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein and secreted (By SIMILARITY)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                s SWISS-PROT entry is copyright. DISEASE: Defects in TNFSP6 are a cause of autoimmune
DISEASE: Defects in TNFSP6 are a cause of autoimmune
lymphoproliferative syndrome (ALPS) [MIM:601859]; also known
lymphoproliferative syndrome (CSS). ALPS is a childhood syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBCELLULAR LOCATION: Type II membrane into the extracellular fluid, probably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: Cytokine that binds to TNFRSF6/FAS, a receptor that transduces the apoptotic signal into cells. May be involved in cytotoxic T cell mediated apoptosis and in T cell development. TNFRSF6/FAS-mediated apoptosis may have a role in the induction of peripheral tolerance, in the antigen-stimulated suicide of mature T cells, or both. Binding to the decoy receptor TNFRSF6B/DcR3
                                                                                                                                                                                                      PTM: N-glycosylated.

It is belived to be a member of the tumour necrosis factor cytokine family. Its amino acid sequence was deduced from a CDNA clone (AAT72796) isolated from a human placental CDNA library. Apo-2 ligand polypeptides, esp. those corresponding to amino acids 114-281, 41-281, 15-281 or 1-281 of Apo-2 ligand, can be produced by culturing cells transformed or transfected with a vector contg. Apo-2 ligand nucleic acid. They can be used to induce apoptosis in mammals and to treat pathological conditions such as cancer (esp. breast or colon cancer) or to raise antibodies useful in diagnostic assays

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a human Apoptosis inducing molecule-I (C (AIM-I). AIM-I is a member of the tumour necrosis factor (TNP) ligand superfamily. The products can be used in the diagnosis and treatment of disorders related to under-expression, over-expression or altered expression of AIM-I. AIM-I or agonists can be used for treatment of c expression of AIM-I. AIM-I or agonists can be used for treating c autoimmune disorders including systemic lupus erythematosus, immunoproliferative lymphadenopathy (IFL), angioimmunoproliferative lymphadenopathy (IFL), rheumatoid arthritis, c diabetes, and multiple sclerosis, graft versus host disease, to inhibit c neoplasia such as tumour cell growth, to treat restenosis, to regulate haematopoiesis in endothelial cell development, to stimulate peripheral c tolerance and cytotoxic T-cell mediated apoptosis. Antagonists can be used for treating cachexia, cerebral malaria, rheumatoid arthritis or osteoporosis, for preventing graft-host rejection, and as anticipation of HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

Its amino acid sequence was deduced from cDNA clone HuAIC (AAT72848), deposited in vector pDC409 as ATCC 69849. Recombinant TRAIL polypeptides (esp. soluble polypeptides) can be expressed in host cells and used in the treatment of cancer (e.g. leukaemia, lymphoma and melanoma) and viral infections, or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents the human tumour necrosis factor (TNF)-related receptor, TL2 (also known as tumour necrosis factor-related apoptosis-inducing ligand, TRAIL). This protein is used in a method resulting in the isolation of the novel human TNF related receptor, TR6. TR6 polypeptides and polynucleotides can be used in the treatment of chronic and acute inflammation, arthritis, septicaemia, autoimmune diseases (e.g. inflammatory bowel disease, psoriasis), transplant rejection, graft vs. host disease, infection, stroke, ischaemia, acute respiratory disease syndrome, restenosis, brain injury, (acquired autoimmune disease syndrome) AIDS, bone diseases, cancer (e.g. lympho-proliferative disease), atherosclerosis and Alzheimers disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TR6; tumour necrosis factor related receptor; human; treatment; stroke; inflammation; arthritis; septicaemia; autoimmune disease; restenosis; transplant rejection; infection; ischaemia; brain injury; bone disease; acute respiratory disease syndrome; acquired autoimmune disease syndrom AIDS; cancer; atherosclerosis; Alzheimers disease; TRAIL; TNF; TL2. tumour necrosis factor-related apoptosis-inducing ligand.

                                                                                                                                                                                                                                  This represents a human tumour necrosis factor related apoptosis ligand (TRAIL) polypeptide. The human and murine TRAIL polypeptides can induce apoptosis of Jurkat cells. The encoding nucleic acid sequences are useful for producing the recombinant TRAIL polypeptides, which may be useful in studies of apoptosis, to purify leukaemia, lymphoma or melanoma cells (e.g. to isolate antigens for vaccine development). The polypeptides can be used to treat leukaemia, lymphoma or melanoma (e.g. by extracorporeal treatment of blood or bone-marrow), or to treat viral infections
                                                                                                                                                                                                             Sequence 281 AA;
                                                                                                                                                                                                                                                                                                                                                          Claim 1; Col 33-36; 28pp; English.

                                                                                                                                                               The present sequence represents human AGP-1 is a tumour-necrosis cactor (TNR)-related protein, involved in inflammation, myelopolesis and bone resorption. It has the same nucleic acid and amino acid (aa) sequences as the TNF-related apoptosis-induced ligand (TRAII) described In Immunity, 3 (1995) 673. Antibodies (Ab) are used as immunoassay reagents for detecting AGP-1 expression. Nucleic acid complementary to CRAP-1 is used to regulate AGP-1 expression and antagonistic compounds are used to treat inflammation (e.g. rheumatoid arthritis, systemic lupus crythematosus, psoriasis, scleroderma, infection-related inflammation) or complementary to compression of diseases (e.g. osteopycosis, osteomyelltis, hypercalcaemia, Paget's disease). AGP-1 can be used to treat haematopoletic diseases associated with reduction in the number of bone marrow cells, particularly neutrophils and lymphocytes, e.g. where caused by disease, injury or exposure to myelosuppressive agents. Host cells, transformed with expression vectors containing AGP-1 DNA, are used to
